SUPPLEMENTARY MATERIALS

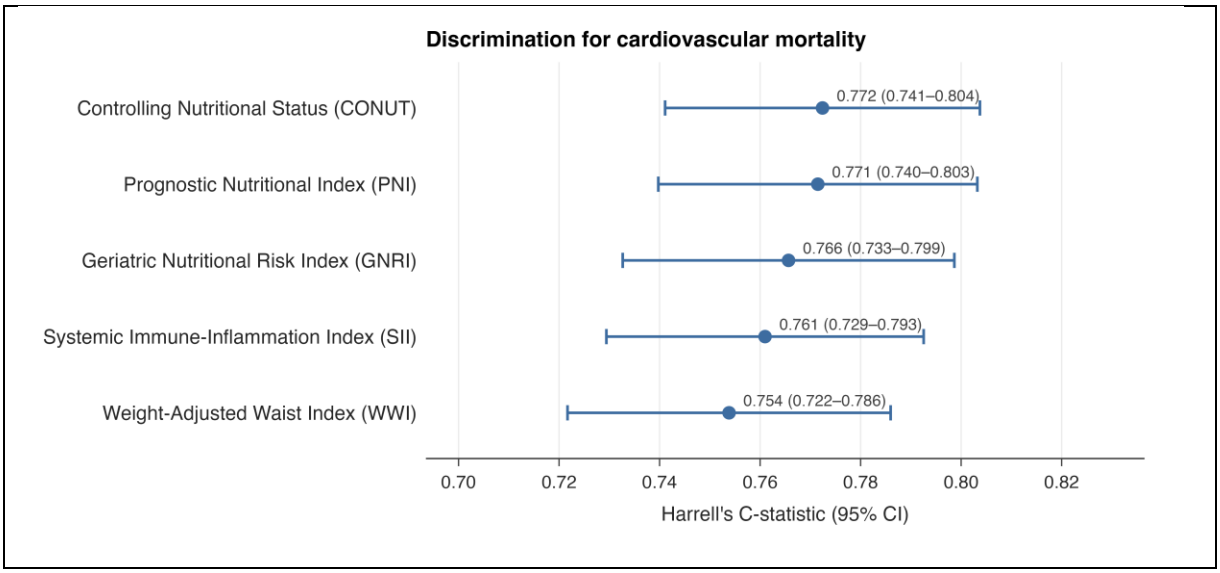

Fig. S1. Forest plot of Harrell's C-statistic for cardiovascular mortality across the five fully adjusted index models. Points denote the pooled Harrell's C-statistic from the fully adjusted Cox model (Model 3) for each index; horizontal lines denote the corresponding 95% confidence intervals (CIs). C-statistics were pooled across 20 multiply imputed datasets using Rubin's rules. The fully adjusted model included age category, sex, race/ethnicity, education, poverty–income ratio (PIR), smoking status, current alcohol use, hypertension, diabetes mellitus, and chronic kidney disease (CKD). CONUT, Controlling Nutritional Status; PIR, poverty–income ratio; GNRI, Geriatric Nutritional Risk Index; SII, Systemic Immune-Inflammation Index; WWI, Weight-Adjusted Waist Index.
