
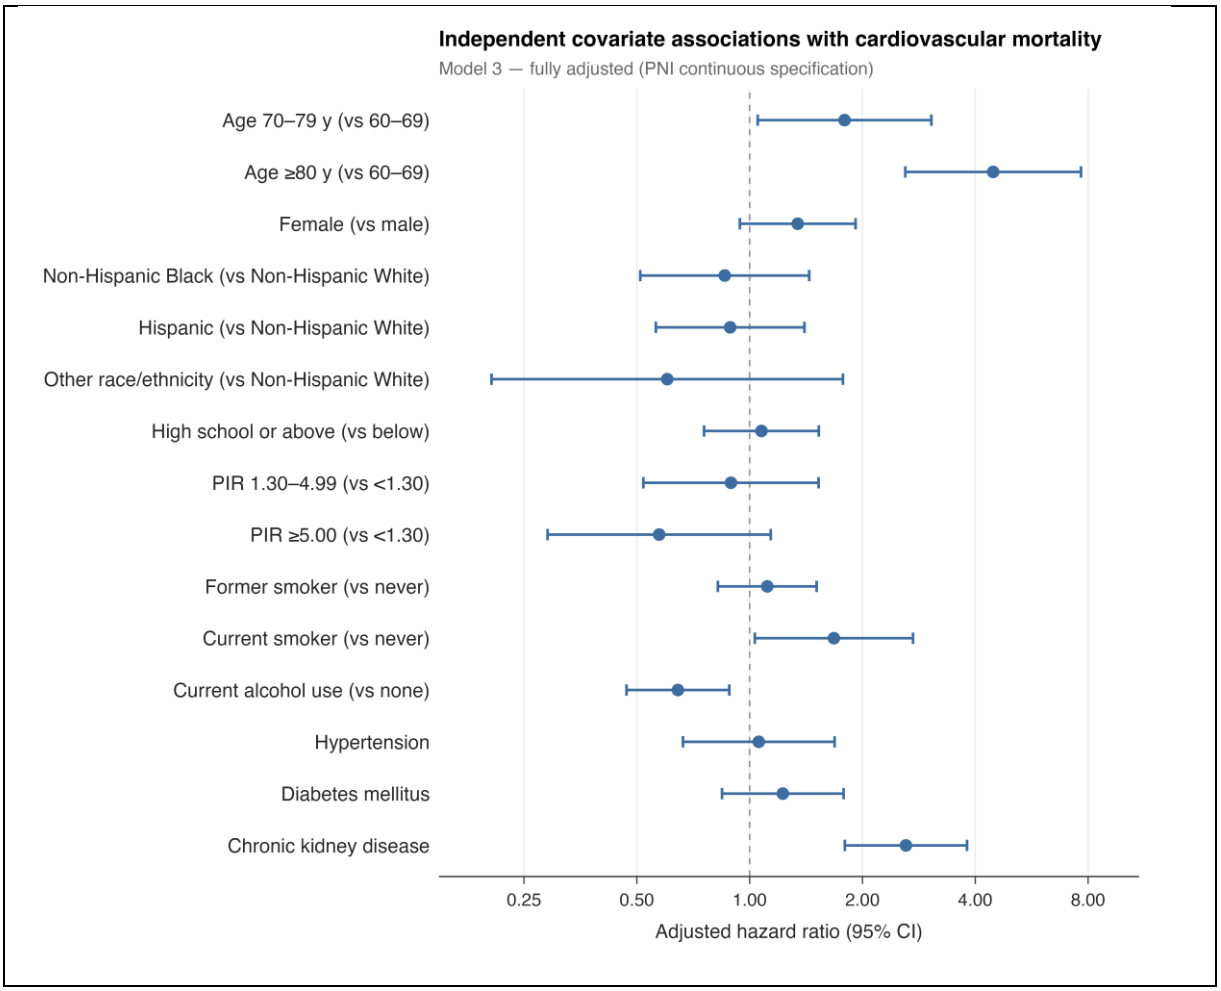

Fig. S2. Forest plot of independent covariate associations with cardiovascular mortality from the fully adjusted Cox model with PNI as the index. Points and horizontal lines denote adjusted hazard ratios (HRs) with 95% confidence intervals (CIs) from the fully adjusted Cox model (Model 3) with the Prognostic Nutritional Index (PNI) as the index of interest, with one row per covariate. The vertical dashed line indicates the null effect (HR=1.00). The model adjusted for the PNI and for age category, sex, race/ethnicity, education, poverty–income ratio (PIR), smoking status, current alcohol use, hypertension, diabetes mellitus, and chronic kidney disease.
